

# UX Design Rationale

Musik App **Lryics** Feature

By Linz Cruise

## The problem

How might we allow the user to view the lyrics on the music player screen?

## Target audience

Young adults,  
Aged 16 to 21  
iOS users

## Link to design

[Figma document](#)

## Previous design

Current design as it stands today

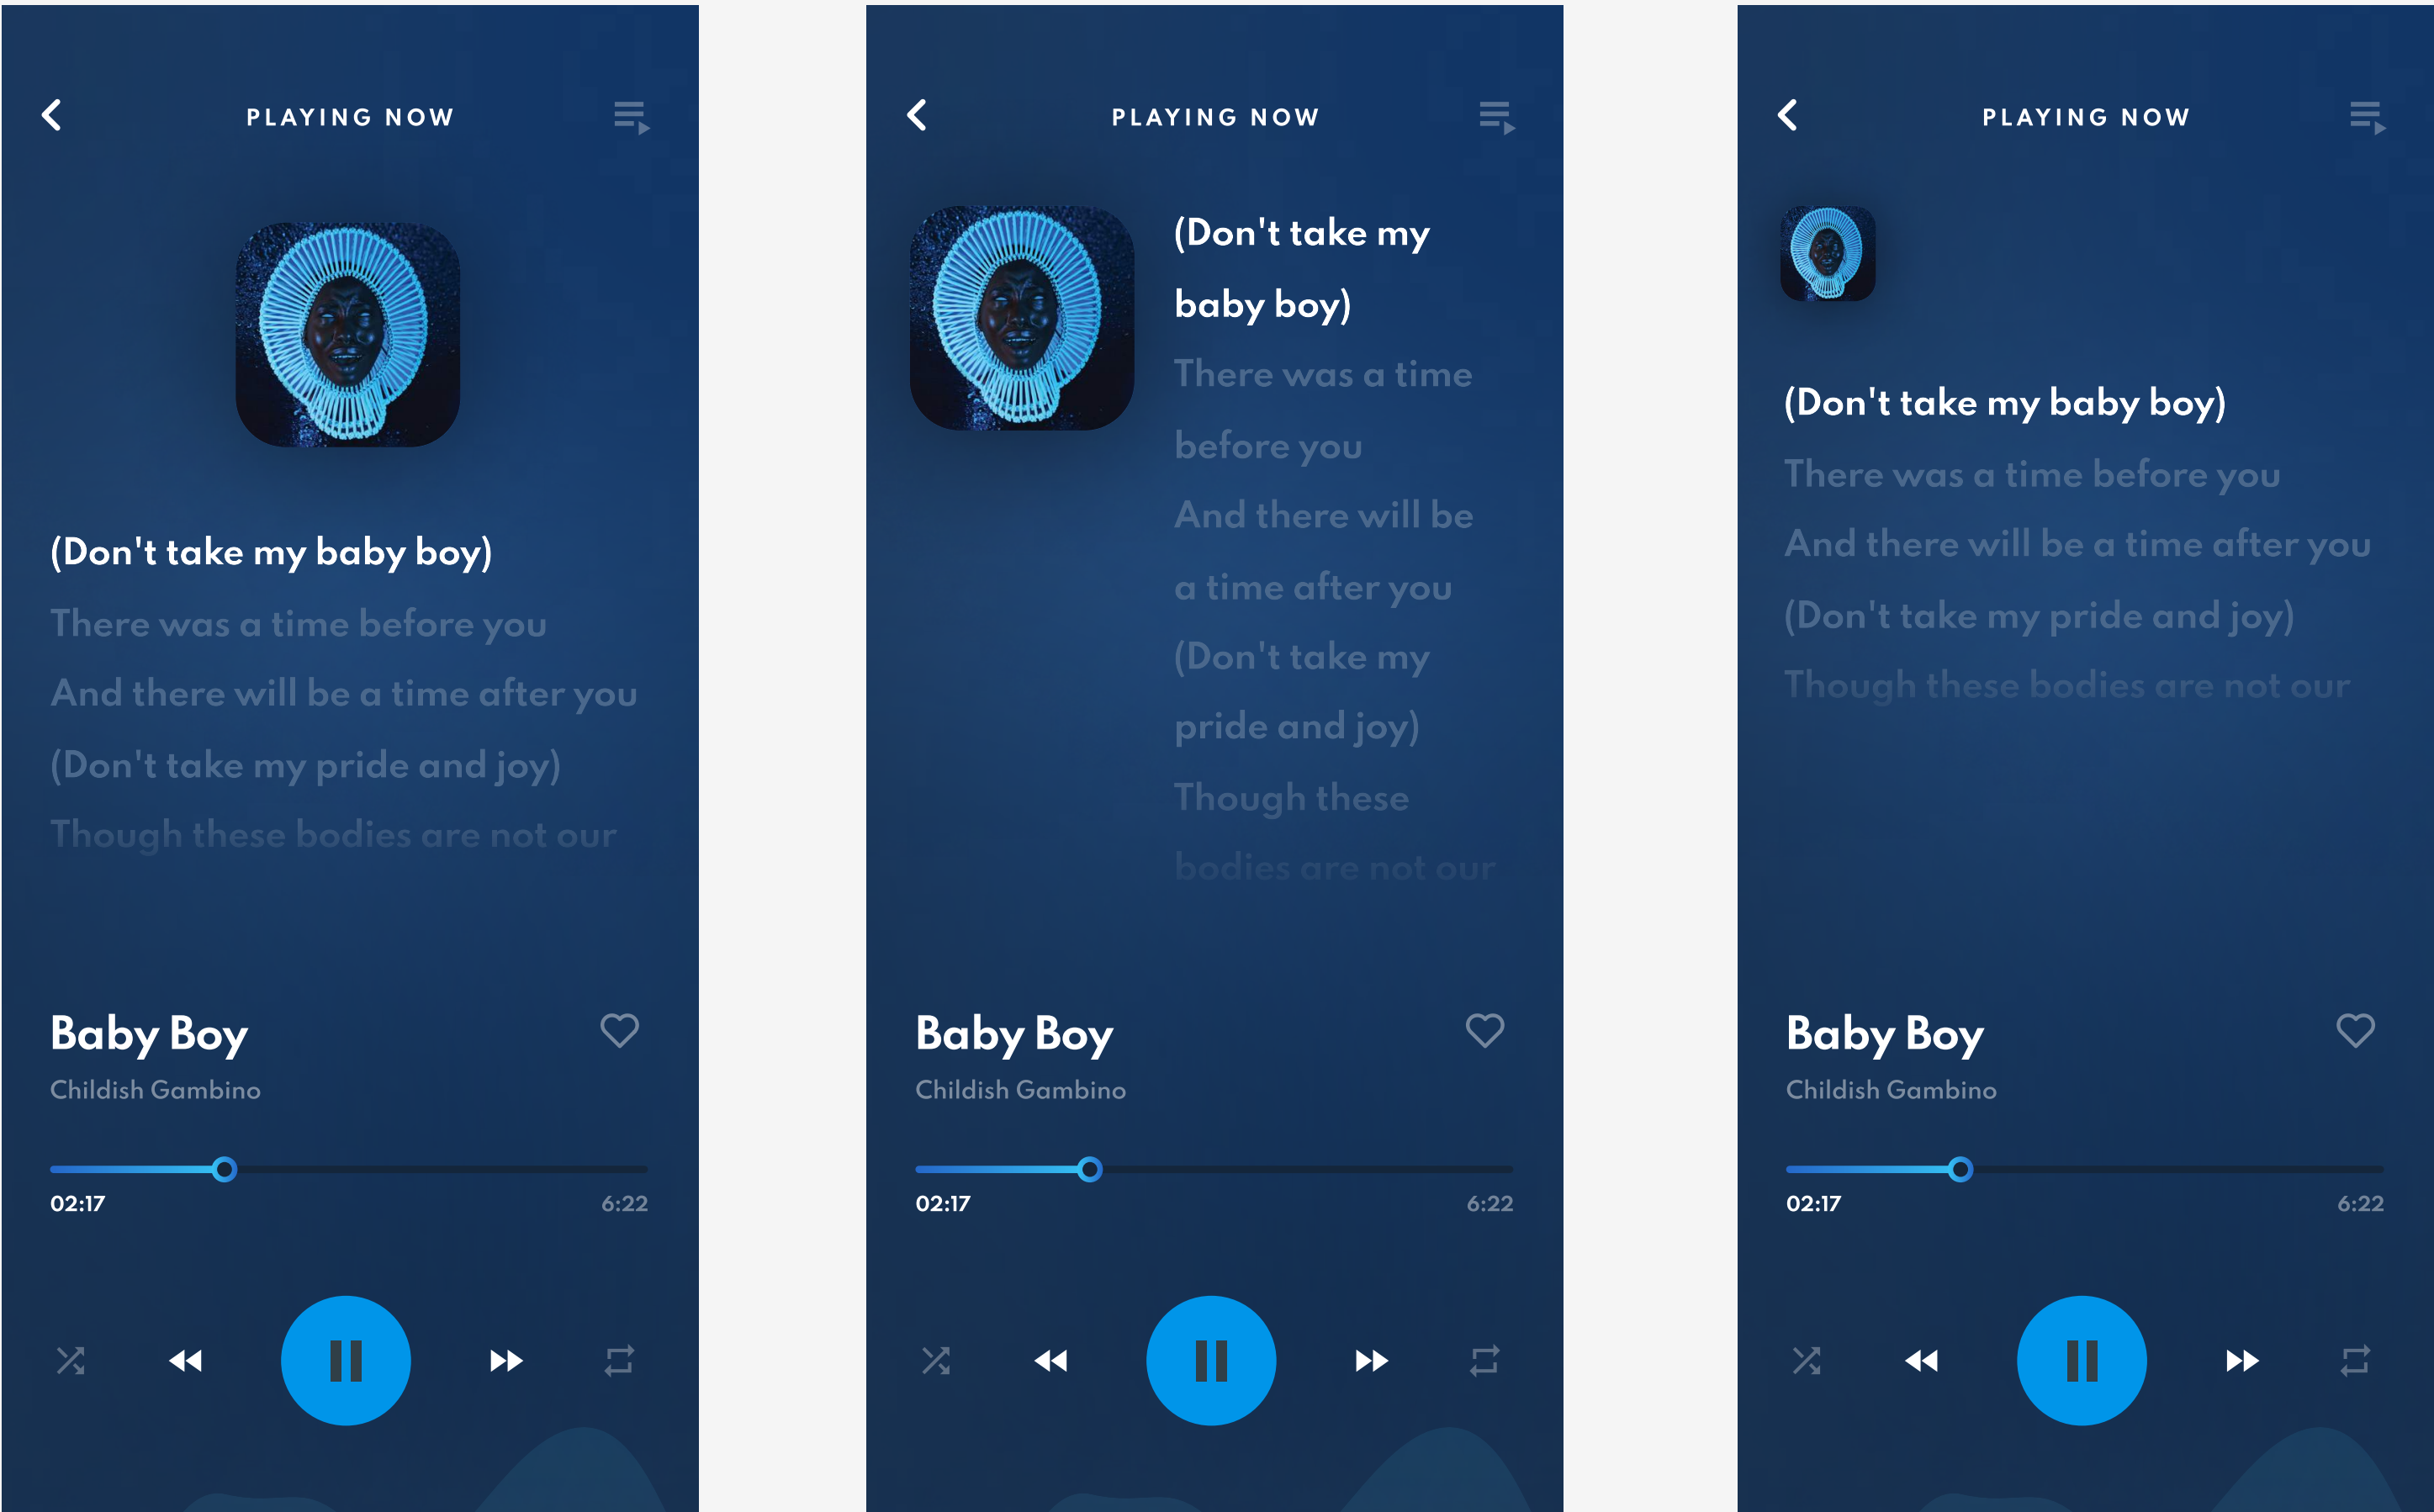

# My process

I did a bunch of visual research digging into what other apps are out there that are doing this now to find some inspiration. Considering our target audience, I knew that the users of the app are tech savvy individuals who understand iconography very well, so I knew I could rely on an icon to navigate users to a lyrics screen.

After some exploring, I quickly came to the conclusion that the lyrics were best suited on a new screen, since they take up so much room, and utilized the existing icon location to add a new one in the same spot.

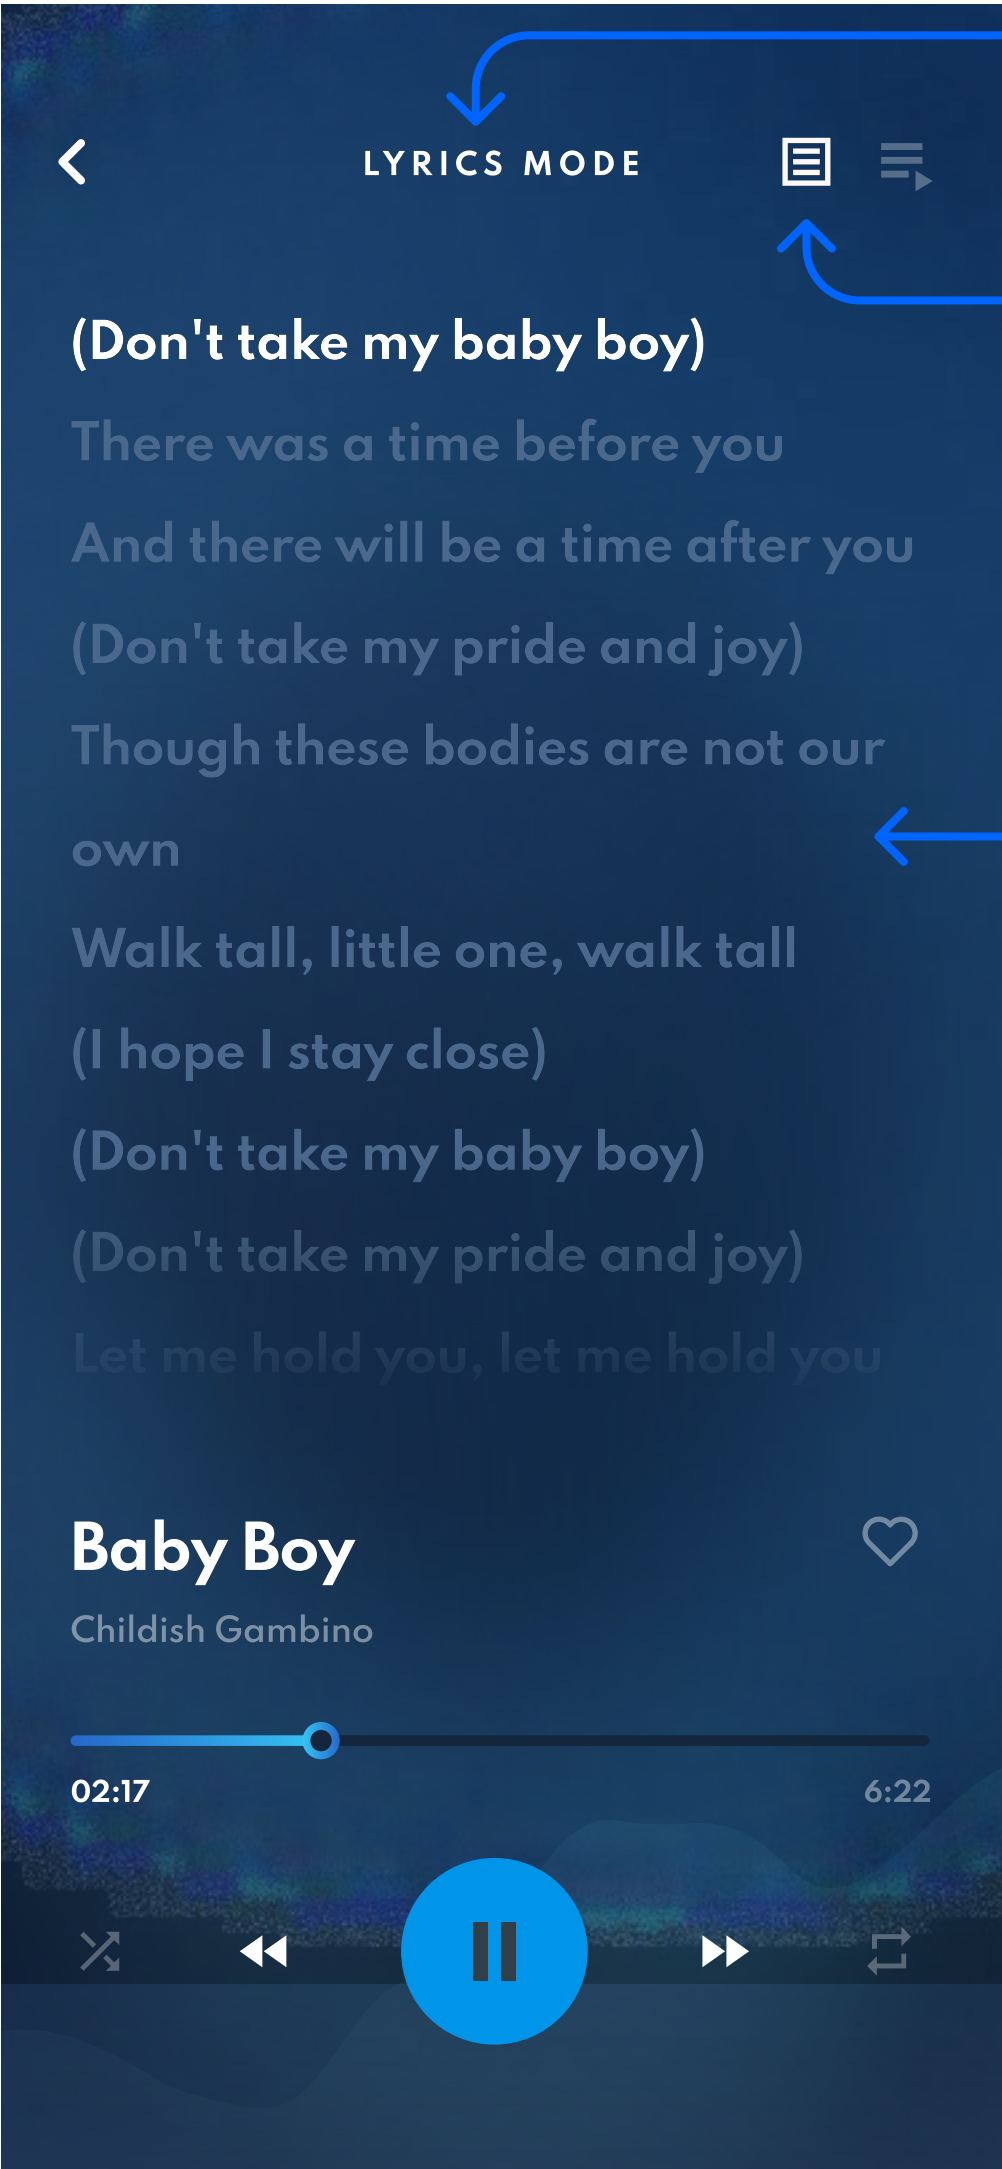

The lyrics mode can be toggled on or off, giving our users the flexibility to either have the lyrics mode if they like or keep our standard player view. I did this because it is important to make sure that we are providing all of our users with their desired experience, so having the option to select which one works best for them helps achieve that.

Rough explorations before final design

# Recommended design

This is the new recommended design based on my explorations.

Updated the title to match the new purpose of the page

New icon created in the top right corner, which acts as a toggle between regular mode and lyrics mode

Target audience is familiar and comfortable with icons

Lots of space is required for lyrics, which a condensed view didn't do - it was too difficult to read

I utilized the space where the artist information was to allow for a full, useful experience
